

Common Signs of Container Damage

If any of the following issues are noticed beyond normal wear and tear, contact the Extera team. We can determine the next steps to keep your operation running efficiently.

⊗ Cracked Corners

Cracks can weaken structural integrity over time. Even minor cracks may spread when containers are handled, stacked, or loaded.

⊗ Missing Runners or Latches

Runners & latches help maintain stability during handling and stacking. When they are missing or damaged, containers may shift, stack unevenly, or become unstable.

⊗ Holes in Base

Holes, especially larger than 2 inches, can affect container strength and allow debris, moisture, or product loss during use.
